Batch Normalization

In this notebook, you will implement the batch normalization layers of a neural network to increase its performance. Please review the details of batch normalization from the lecture notes.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, and their layer structure. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class (cs231n.stanford.edu).

```
In [1]: ## Import and setups
        import time
        import numpy as np
        import matplotlib.pyplot as plt
        from nndl.fc_net import *
        from nndl.lavers import *
        from utils.data_utils import get_CIFAR10_data
        from utils.gradient_check import eval_numerical_gradient, eval_numerical_gradient_array
        from utils.solver import Solver
        %matplotlib inline
        plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
        plt.rcParams['image.interpolation'] = 'nearest'
        plt.rcParams['image.cmap'] = 'gray'
        # for auto-reloading external modules
        # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipython
        %load_ext autoreload
        %autoreload 2
        def rel_error(x, y):
           """ returns relative error """
          return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
In [2]: # Load the (preprocessed) CIFAR10 data.
        data = get_CIFAR10_data()
        for k in data.keys():
         print('{}: {} '.format(k, data[k].shape))
       X_train: (49000, 3, 32, 32)
       y_train: (49000,)
       X val: (1000, 3, 32, 32)
       y_val: (1000,)
       X_test: (1000, 3, 32, 32)
```

Batchnorm forward pass

y_test: (1000,)

Implement the training time batchnorm forward pass, batchnorm_forward , in nndl/layers.py . After that, test your implementation by running the following cell.

```
In [3]: # Check the training-time forward pass by checking means and variances
        # of features both before and after batch normalization
        # Simulate the forward pass for a two-layer network
        N, D1, D2, D3 = 200, 50, 60, 3
        X = np.random.randn(N, D1)
        W1 = np.random.randn(D1, D2)
        W2 = np.random.randn(D2, D3)
        a = np.maximum(0, X.dot(W1)).dot(W2)
        print('Before batch normalization:')
        print(' means: ', a.mean(axis=0))
        print(' stds: ', a.std(axis=0))
        # Means should be close to zero and stds close to one
        print('After batch normalization (gamma=1, beta=0)')
        a_norm, _ = batchnorm_forward(a, np.ones(D3), np.zeros(D3), {'mode': 'train'})
        print(' mean: ', a_norm.mean(axis=0))
        print(' std: ', a_norm.std(axis=0))
        # Now means should be close to beta and stds close to gamma
        gamma = np.asarray([1.0, 2.0, 3.0])
        beta = np.asarray([11.0, 12.0, 13.0])
        a_norm, _ = batchnorm_forward(a, gamma, beta, {'mode': 'train'})
        print('After batch normalization (nontrivial gamma, beta)')
        print(' means: ', a_norm.mean(axis=0))
print(' stds: ', a_norm.std(axis=0))
```

```
means: [11. 12. 13.]
         stds: [0.99999999 1.99999999 2.99999998]
        Implement the testing time batchnorm forward pass, batchnorm_forward , in nndl/layers.py . After that, test your implementation by running the following
In [4]: # Check the test-time forward pass by running the training-time
        # forward pass many times to warm up the running averages, and then
        \# checking the means and variances of activations after a test-time
        # forward pass.
        N, D1, D2, D3 = 200, 50, 60, 3
        W1 = np.random.randn(D1, D2)
        W2 = np.random.randn(D2, D3)
        bn param = {'mode': 'train'}
        gamma = np.ones(D3)
        beta = np.zeros(D3)
        for t in np.arange(50):
          X = np.random.randn(N, D1)
          a = np.maximum(0, X.dot(W1)).dot(W2)
          batchnorm_forward(a, gamma, beta, bn_param)
        bn_param['mode'] = 'test'
        X = np.random.randn(N, D1)
        a = np.maximum(0, X.dot(W1)).dot(W2)
        a_norm, _ = batchnorm_forward(a, gamma, beta, bn_param)
```

Batchnorm backward pass

dbeta error: 1.0125231268487045e-10

noisier than training-time forward passes.
print('After batch normalization (test-time):')
print(' means: ', a_norm.mean(axis=0))
print(' stds: ', a_norm.std(axis=0))
After batch normalization (test-time):

means: [0.01185134 0.03600385 -0.00797025] stds: [1.01765819 1.02557049 1.05681004]

Means should be close to zero and stds close to one, but will be

Before batch normalization:

means: [-5.08989825 27.6917655 -59.2448762] stds: [30.49398011 30.42575169 30.53427394] After batch normalization (gamma=1, beta=0)

std: [0.99999999 0.99999999 0.99999999]
After batch normalization (nontrivial gamma, beta)

mean: [2.11636264e-17 9.76996262e-17 3.79696274e-16]

Implement the backward pass for the batchnorm layer, batchnorm_backward in nnd1/layers.py . Check your implementation by running the following cell.

```
In [5]: # Gradient check batchnorm backward pass
        N, D = 4, 5
        x = 5 * np.random.randn(N, D) + 12
        gamma = np.random.randn(D)
        beta = np.random.randn(D)
        dout = np.random.randn(N, D)
        bn_param = {'mode': 'train'}
        fx = lambda x: batchnorm_forward(x, gamma, beta, bn_param)[0]
        fg = lambda gamma: batchnorm_forward(x, gamma, beta, bn_param)[0]
        fb = lambda beta: batchnorm_forward(x, gamma, beta, bn_param)[0]
        dx_num = eval_numerical_gradient_array(fx, x, dout)
        da_num = eval_numerical_gradient_array(fg, gamma, dout)
        db_num = eval_numerical_gradient_array(fb, beta, dout)
         _, cache = batchnorm_forward(x, gamma, beta, bn_param)
        dx, dgamma, dbeta = batchnorm_backward(dout, cache)
        print('dx error: ', rel_error(dx_num, dx))
        print('dgamma error: ', rel_error(da_num, dgamma))
        print('dbeta error: ', rel_error(db_num, dbeta))
       dx error: 1.8322366430034198e-08
       dgamma error: 9.710581653131353e-12
```

Implement a fully connected neural network with batchnorm layers

Modify the FullyConnectedNet() class in nndl/fc_net.py to incorporate batchnorm layers. You will need to modify the class in the following areas:

- (1) The gammas and betas need to be initialized to 1's and 0's respectively in __init__ .
- (2) The batchnorm_forward layer needs to be inserted between each affine and relu layer (except in the output layer) in a forward pass computation in loss . You may find it helpful to write an affine_batchnorm_relu() layer in nndl/layer_utils.py although this is not necessary.
- (3) The batchnorm backward layer has to be appropriately inserted when calculating gradients.

After you have done the appropriate modifications, check your implementation by running the following cell.

Note, while the relative error for W3 should be small, as we backprop gradients more, you may find the relative error increases. Our relative error for W1 is on the order of 1e-4

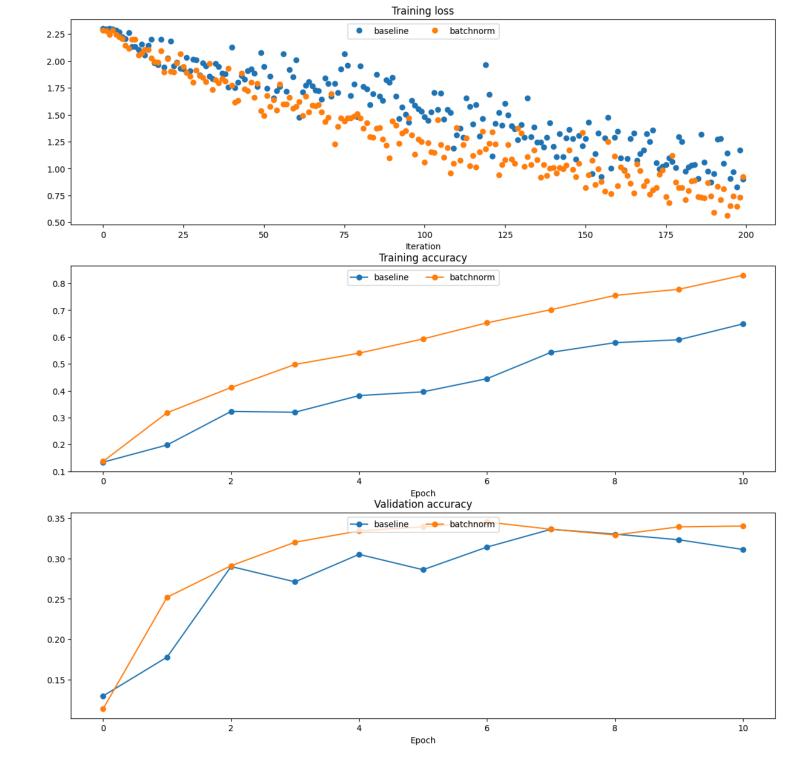

```
In [6]: N, D, H1, H2, C = 2, 15, 20, 30, 10
        X = np.random.randn(N, D)
        y = np.random.randint(C, size=(N,))
        for reg in [0, 3.14]:
          print('Running check with reg = ', reg)
          model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
                                    reg=reg, weight_scale=5e-2, dtype=np.float64,
                                    use_batchnorm=True)

         plt.semilogx(weight_scales, best_train_accs, '-o', label='baseline')
         plt.semilogx(weight_scales, bn_best_train_accs, '-o', label='batchnorm')
         plt.legend()
         plt.subplot(3, 1, 3)
         plt.title('Final training loss vs weight initialization scale')
         plt.xlabel('Weight initialization scale')
         plt.ylabel('Final training loss')
         plt.semilogx(weight_scales, final_train_loss, '-o', label='baseline')
         plt.semilogx(weight_scales, bn_final_train_loss, '-o', label='batchnorm')
         plt.legend()
         plt.gcf().set_size_inches(10, 15)
         plt.show()
```

Question:

In the cell below, summarize the findings of this experiment, and WHY these results make sense.

Answer:

Batch normalization helps in training stability. The batchnorm relatively performs better than baseline in both training and validation accuracy. Also, without batch normalization, the model is more sensitive to weight initialization. With batch normalization, the model performs well across a wider range of initialization scales with less sensitive to weight initilization.
